SOGET, world leader in the Port Community System, completes its offer with TK'Blue to offer its customers accurate and automatic GHG reporting..

SOGET supports port fluidity by organising intelligent, shared and instantaneous management of logistics chain information for public and private operators. Its solutions are turnkey, innovative and combine business process expertise and technological excellence, in close proximity to its customers and partners.

It was therefore quite natural for SOGET to choose TK'Blue to provide its hundreds of forwarding agents, carriers and shippers with GHG information on their operations.

Thanks to this new environmental brick, the SOGET system offers its customers instant access to precise, detailed, compliant and accredited GHG reporting according to the national and international standards in force, for all operations upstream and downstream of the port passage.

Precise tracking of the impact by maritime, road, rail and river segment, from end to end of the transport chain, enables real performance monitoring, immediately generating both economic and environmental benefits.

About TK'Blue Agency - www.tkblueagency.com

TK'Blue is a transport labelling and rating agency organized as a service platform. It measures, rates and values the eco-responsible performance of each of the players - transporters and contractors - in compliance with legislative and regulatory requirements relating to CO2 emissions and CSR, at national and European levels (Bureau Veritas certified). Its European governance, composed of more than seventy representatives of all the players in the supply chain, enables it to ensure its legitimacy, credibility, evolution and independence over the long term. The quadrilingual platform is accessible in SaaS mode on the Cloud, free of charge for all freight carriers of all modes. Major groups such as Carrefour, Saint-Gobain, Rémy Cointreau are already involved in the TK'Blue dynamic. By combining eco-responsibility and the economic performance of logistics choices, TK'Blue responds to the demands of each player in the transport sector: control of transport flows, alerting of quality drifts, reduction of the consequences of poor transport purchases, commitment to a CSR policy, and response to national and European CO2/GES and CSR regulations and legislation.
